Introduction

As the author of X_YPersian package (a package for Persian typesetting in L^AT_EX over X_YL^AT_EX), I always wanted to write a package that make writing in colours easy in bidirectional texts. However there are packages color and xcolor, but writing bidirectional texts in different colours using these packages is a nightmare and the colours of the text will get mixed. In fact, the bidi package has a patch where one could use the packages mentioned above to write text in colour but unfortunately that text has got to be not more than a line, otherwise the colour of the text gets mixed.

Thus, I wrote xecolour package which allows the user to write texts in 140 different colours without any problem. I have used X_YL^AT_EX's feature to define 140 colours and I believe these 140 colours are all one needs. The command names are just the names of colours (i.e. \blue for blue colour) and the general syntax is:

`\colourname{<text>}`

In the next section, you will see a sample of each colour, and at the end of this manual, in the index part, all commands are written in alphabetical order. So if you wish to use a specific colour, please look at the index and find the command you should use.
