Chapter 1. Setup

1.1. Prerequisites

You can start with this tutorial, or you can do "Getting Started with Cayenne" first and then continue with this tutorial.

This chapter lists the recommended software used in the tutorial.

1.1.1. Java

Cayenne 4.2 requires JDK 1.8 or newer.

1.1.2. IntelliJ IDEA IDE

Download and install the free IntelliJ IDEA Community Edition IDE. This tutorial uses version 2017.1, but any recent IntelliJ IDEA version and edition will do.

1.1.3. Maven

Two Maven plugins are used:

- **cayenne-maven-plugin** - among other things, allows to reverse-engineer the Cayenne model from the database and to update the model after the database has been changed.
- **cayenne-modeler-maven-plugin** - provides a convenient way of starting the Cayenne Modeler

1.1.4. MySQL

MySQL database server is used for demonstrating Cayenne's ability to read the DB schema and to build/update the Cayenne model from it.

You can create test database with any tools you comfortable with, here is full DB schema that will be used in this tutorial:

```
CREATE SCHEMA IF NOT EXISTS cayenne_demo; USE cayenne_demo;
CREATE TABLE artist (DATE_OF_BIRTH DATE NULL, ID INT NOT NULL AUTO_INCREMENT, NAME
VARCHAR(200) NULL, PRIMARY KEY (ID)) ENGINE=InnoDB;
CREATE TABLE gallery (ID INT NOT NULL AUTO_INCREMENT, NAME VARCHAR(200) NULL, PRIMARY
KEY (ID)) ENGINE=InnoDB;
CREATE TABLE painting (ARTIST_ID INT NULL, GALLERY_ID INT NULL, ID INT NOT NULL
AUTO_INCREMENT, NAME VARCHAR(200) NULL, PRIMARY KEY (ID)) ENGINE=InnoDB;
ALTER TABLE painting ADD FOREIGN KEY (ARTIST_ID) REFERENCES artist (ID) ON DELETE
CASCADE;
ALTER TABLE painting ADD FOREIGN KEY (GALLERY_ID) REFERENCES gallery (ID) ON DELETE
CASCADE;
```

You can save it to `cayenne_demo.sql` file and import to your database with following command:

```
$ mysql < cayenne_demo.sql
```

1.2. Maven Project

The goal of this chapter is to create a new Java project in IntelliJ IDEA and to setup Maven Cayenne plugin

1.2.1. Create a new Project in IntelliJ IDEA

In IntelliJ IDEA select **File > New > Project...** and then select "Maven" and click "Next". In the dialog shown on the screenshot below, fill the "Group Id" and "Artifact Id" fields and click "Next".

On next dialog screen you can customize directory for your project and click "Finish". Now you should have a new empty project.

1.2.2. Plugin setup

Next step is setting up Cayenne plugin in **pom.xml** file. For the convenience let's define Cayenne version that we will use across project file:

```
<properties>
  <cayenne.version>4.2</cayenne.version>
</properties>
```

Next step is to include plugin. Here is code snippet that enable `cayenne-maven-plugin` in our demo project:

```
<build>
  <plugins>
    <plugin>
      <groupId>org.apache.cayenne.plugins</groupId>
      <artifactId>cayenne-maven-plugin</artifactId>
      <version>${cayenne.version}</version>
    </plugin>
  </plugins>
</build>
```

Chapter 2. Importing database

2.1. Reverse engineering database

Now we have everything ready and can proceed to importing Cayenne model from our MySQL database

2.1.1. Configuring plugin

To let Cayenne plugin do its job we must tell it what to import and where it should get data. So let's begin, here is sample settings for the data source:

```
<plugin>
...
<configuration>
  <dataSource>
    <driver>com.mysql.jdbc.Driver</driver>
    <url>jdbc:mysql://127.0.0.1:3306/cayenne_demo</url>
    <username>root</username>
    <password>your-mysql-password</password>
  </dataSource>
</configuration>
<dependencies>
  <dependency>
    <groupId>mysql</groupId>
    <artifactId>mysql-connector-java</artifactId>
    <version>6.0.5</version>
  </dependency>
</dependencies>
```

Don't forget to set your actual MySQL login and password

We have told plugin where it should load data from, now let's set where it should store Cayenne model:

```
<configuration>
...
</dataSource>
<cayenneProject>${project.basedir}/src/main/resources/cayenne/cayenne-
project.xml</cayenneProject>
<map>${project.basedir}/src/main/resources/datamap.map.xml</map>
...
```

And a last small step we need to do is to set default package where our model classes will be and catalog where our tables are:

```
<configuration>
  ...</map>
  <dbImport>
    <defaultPackage>org.apache.cayenne.tutorial.persistent</defaultPackage>
    <catalog>cayenne_demo</catalog>
  </dbImport>
```

2.1.2. Running plugin

Finally we can run db import, it is as easy as just running this command in terminal:

```
$ mvn cayenne:cdbimport
```

If everything was setup properly you should see output like this:

```
...
[INFO] +++ Connecting: SUCCESS.
[INFO] Detected and installed adapter: org.apache.cayenne.dba.mysql.MySQLAdapter
[INFO] Table: cayenne_demo.artist
[INFO] Table: cayenne_demo.gallery
[INFO] Table: cayenne_demo.painting
[INFO] Db Relationship : toOne (painting.GALLERY_ID, gallery.ID)
[INFO] Db Relationship : toMany (gallery.ID, painting.GALLERY_ID)
[INFO] Db Relationship : toOne (painting.ARTIST_ID, artist.ID)
[INFO] Db Relationship : toMany (artist.ID, painting.ARTIST_ID)
[INFO]
[INFO] Map file does not exist. Loaded db model will be saved into '~/work/cayenne/db-
first-tutorial/src/main/resources/datamap.map.xml'
[INFO]
[INFO] Detected changes:
[INFO] Create Table      artist
[INFO] Create Table      painting
[INFO] Create Table      gallery
[INFO]
[WARNING] Can't find ObjEntity for painting
[WARNING] Db Relationship (Db Relationship : toMany (artist.ID, painting.ARTIST_ID))
will have GUESSED Obj Relationship reflection.
[WARNING] Can't find ObjEntity for gallery
[WARNING] Db Relationship (Db Relationship : toOne (painting.GALLERY_ID, gallery.ID))
will have GUESSED Obj Relationship reflection.
[INFO] Migration Complete Successfully.
```

You can open created **datamap.map.xml** file and check it's content in IDEA:

Great! We now have Cayenne DataMap file that describe model from our database and cayenne-project.xml file.

If you have some problems with configuration you can always delete `datamap.map.xml` file and try again.

2.1.3. Setup Modeler Maven plugin

Cayenne Modeler can be helpful in case you want to make some customizations to your model, though it's usage optional.

To launch Modeler we'll use `cayenne-modeler-maven-plugin`. Just include it in `pom.xml` like we did with `cayenne-maven-plugin` and tell where your project is:

```

<plugin>
  <groupId>org.apache.cayenne.plugins</groupId>
  <artifactId>cayenne-modeler-maven-plugin</artifactId>
  <version>${cayenne.version}</version>
  <configuration>
    <modelFile>${project.basedir}/src/main/resources/cayenne-
project.xml</modelFile>
  </configuration>
</plugin>

```

To launch it simply run:

```
$ mvn cayenne-modeler:run
```

Chapter 3. Advanced usage of cdbimport

3.1. Updating model

We now have everything we need, let's try some more features of plugin.

3.1.1. Update DDL

To show next feature let's imagine that over some time our database schema has evolved and we need to synchronize it with our model, no problem we can simply run `cdbimport` again and all changes will be loaded to model. We use following SQL script to alter our demo database:

```
CREATE TABLE cayenne_demo.painting_info (INFO VARCHAR(255) NULL, PAINTING_ID INT NOT
NULL, PRIMARY KEY (PAINTING_ID)) ENGINE=InnoDB;
ALTER TABLE cayenne_demo.gallery ADD COLUMN FOUNDED_DATE DATE;
ALTER TABLE cayenne_demo.painting_info ADD FOREIGN KEY (PAINTING_ID) REFERENCES
cayenne_demo.painting (ID);
```

3.1.2. Run cdbimport

Now we can simply run again

```
$ mvn cayenne:cdbimport
```

You should see output similar to this:

```
...
[INFO] Table: cayenne_demo.artist
[INFO] Table: cayenne_demo.gallery
[INFO] Table: cayenne_demo.painting
[INFO] Table: cayenne_demo.painting_info
[INFO] Db Relationship : toOne (painting_info.PAINTING_ID, painting.ID)
[INFO] Db Relationship : toOne (painting.ID, painting_info.PAINTING_ID)
[INFO] Db Relationship : toOne (painting.GALLERY_ID, gallery.ID)
[INFO] Db Relationship : toMany (gallery.ID, painting.GALLERY_ID)
[INFO] Db Relationship : toOne (painting.ARTIST_ID, artist.ID)
[INFO] Db Relationship : toMany (artist.ID, painting.ARTIST_ID)
[INFO]
[INFO] Detected changes:
[INFO] Create Table painting_info
[INFO] Add Column gallery.FOUNDED_DATE
[INFO] Add Relationship paintingInfo painting->painting_info.PAINTING_ID
[INFO]
[INFO] Migration Complete Successfully.
```

Let's run Modeler and check that all changes are present in our model:

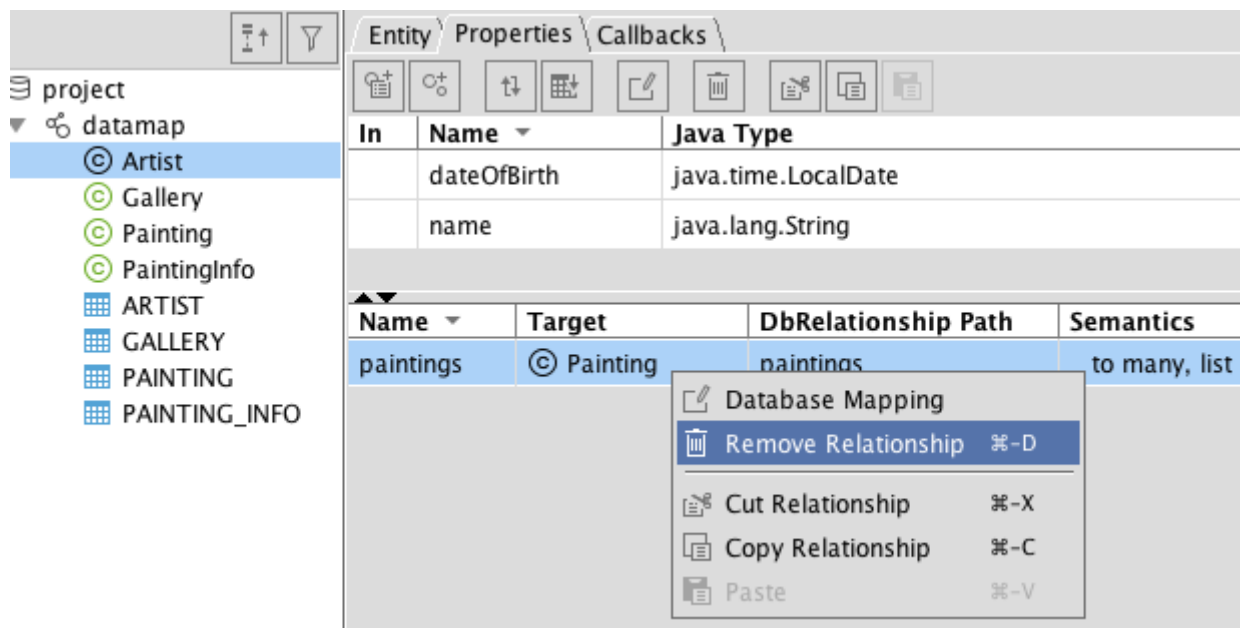

```
$ mvn cayenne-modeler:run
```

Great! New table and ObjEntity are in place, as well as a new field.

3.1.3. Customizing Model

There is often a need to customize model to better fit it to your application requirements, such customization can be simple removal of toMany part of a relationship between two objects. Let's do it, in a Modeler just select and remove relationship **paintings** in Artist object:

Now if you run

```
$ mvn cayenne:cdbimport
```

it still find nothing to do:

```
...  
[INFO] Detected changes: No changes to import.
```

`cdbimport` will skip only modifications in Object layer (e.g. `ObjEntities`, `ObjAttributes` and `ObjRelationships`), if you modify Db layer your changes will be overridden by next run of `cdbimport`.

3.2. Advanced filtering

Final part of our tutorial is about fine-tuning what you load from DB into your model.

3.2.1. Update schema

Let's add some information to our database, that we don't need in our model:

```
CREATE TABLE cayenne_demo.legacy_painting_info (ID INT NOT NULL AUTO_INCREMENT, INFO  
VARCHAR(255) NULL, PAINTING_ID INT NOT NULL, PRIMARY KEY (ID)) ENGINE=InnoDB;  
ALTER TABLE cayenne_demo.artist ADD COLUMN __service_column INT;  
ALTER TABLE cayenne_demo.gallery ADD COLUMN __service_column INT;  
ALTER TABLE cayenne_demo.painting ADD COLUMN __service_column INT;
```

3.2.2. Configure filtering

Now we need to tell `cdbimport` what we don't need in our model, for that we'll just add following into `<configuration>` section:

```
<excludeTable>legacy_painting_info</excludeTable>  
<excludeColumn>__service_column</excludeColumn>
```

After running

```
$ mvn cayenne:cdbimport
```

we still don't get any changes, exactly as expected:

```
...  
[INFO] Detected changes: No changes to import.
```

Chapter 4. Java code

4.1. Generating Java classes

Now as we have our model ready let's generate Java code that actually will be used in application. In order to do that we'll use same maven plugin, but different goal, namely `cgen`. It has many options to configure but default values will do for our case, so we can just call it:

```
$ mvn cayenne:cgen
```

You should see output telling that everything is done, like this:

```
[INFO] Generating superclass file:
.../src/main/java/org/apache/cayenne/tutorial/persistent/auto/_Artist.java
[INFO] Generating class file:
.../src/main/java/org/apache/cayenne/tutorial/persistent/Artist.java
[INFO] Generating superclass file:
.../src/main/java/org/apache/cayenne/tutorial/persistent/auto/_Gallery.java
[INFO] Generating class file:
.../src/main/java/org/apache/cayenne/tutorial/persistent/Gallery.java
[INFO] Generating superclass file:
.../src/main/java/org/apache/cayenne/tutorial/persistent/auto/_Painting.java
[INFO] Generating class file:
.../src/main/java/org/apache/cayenne/tutorial/persistent/Painting.java
[INFO] Generating superclass file:
.../src/main/java/org/apache/cayenne/tutorial/persistent/auto/_PaintingInfo.java
[INFO] Generating class file:
.../src/main/java/org/apache/cayenne/tutorial/persistent/PaintingInfo.java
[INFO] -----
[INFO] BUILD SUCCESS
[INFO] -----
```

In IDEA you should be able to see these newly generated classes:

Note that Cayenne code is unrecognized, that's because we need to include Cayenne as dependency,

let's do this in `pom.xml` file:

```
<project>
  ...
  <dependencies>
    <dependency>
      <groupId>org.apache.cayenne</groupId>
      <artifactId>cayenne-server</artifactId>
      <version>${cayenne.version}</version>
    </dependency>
  </dependencies>
```

Additionally we need to tell `Maven compiler plugin` that our code uses Java 8:

```
<build>
  <plugins>
    ...
    <plugin>
      <artifactId>maven-compiler-plugin</artifactId>
      <configuration>
        <source>1.8</source>
        <target>1.8</target>
      </configuration>
    </plugin>
  </build>
```

If all done right your code now shouldn't have any errors. To be sure you can build it:

```
$ mvn compile
```

4.2. Getting started with ObjectContext

In this section we'll write a simple main class to run our application, and get a brief introduction to Cayenne `ObjectContext`.

4.2.1. Creating the Main Class

- In IDEA create a new class called `Main` in the `org.apache.cayenne.tutorial` package.
- Create a standard `main()` method to make it a runnable class:

```
package org.apache.cayenne.tutorial;

public class Main {

    public static void main(String[] args) {

    }

}
```

- The first thing you need to be able to access the database is to create a `ServerRuntime` object (which is essentially a wrapper around Cayenne stack) and use it to obtain an instance of an `ObjectContext`.

```
package org.apache.cayenne.tutorial;

import org.apache.cayenne.ObjectContext;
import org.apache.cayenne.configuration.server.ServerRuntime;

public class Main {

    public static void main(String[] args) {
        ServerRuntime cayenneRuntime = ServerRuntime.builder()
            .dataSource(DataSourceBuilder
                .url("jdbc:mysql://127.0.0.1:3306/cayenne_demo")
                .driver("com.mysql.cj.jdbc.Driver")
                .userName("root") // TODO: change to your actual username and
password
                .password("your-password").build())
            .addConfig("cayenne-project.xml")
            .build();
        ObjectContext context = cayenneRuntime.newContext();
    }

}
```

`ObjectContext` is an isolated "session" in Cayenne that provides all needed API to work with data. `ObjectContext` has methods to execute queries and manage persistent objects. We'll discuss them in the following sections. When the first `ObjectContext` is created in the application, Cayenne loads XML mapping files and creates a shared access stack that is later reused by other `ObjectContexts`.

- Let's now add some code that will create persistent object:

```
Artist artist = context.newObject(Artist.class);
artist.setName("Picasso");
context.commitChanges();
```

4.2.2. Running Application

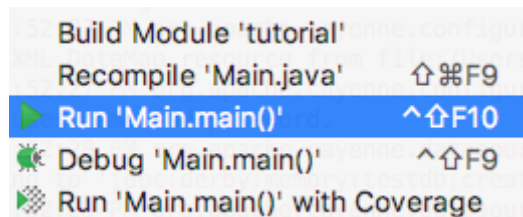

Let's check what happens when you run the application. But before we do that we need to add another dependencies to the `pom.xml` - MySQL Jdbc driver and simple logger. The following piece of XML needs to be added to the `<dependencies>...</dependencies>` section, where we already have Cayenne jars:

```
<dependency>
  <groupId>mysql</groupId>
  <artifactId>mysql-connector-java</artifactId>
  <version>6.0.5</version>
</dependency>
<dependency>
  <groupId>org.slf4j</groupId>
  <artifactId>slf4j-simple</artifactId>
  <version>1.7.25</version>
</dependency>
```

Cayenne uses Slf4j logging API, here we will use simple backend that prints everything to console

Now we are ready to run. Right click the "Main" class in IDEA and select "Run 'Main.main()'".

In the console you'll see output similar to this, indicating that Cayenne stack has been started:

```
[main] INFO: Loading XML configuration resource from file:/.../cayenne-project.xml
[main] INFO: Loading XML DataMap resource from file:/.../datamap.map.xml
...
[main] INFO org.apache.cayenne.datasource.DriverDataSource - +++ Connecting: SUCCESS.
[main] INFO org.apache.cayenne.log.JdbcEventLogger - --- transaction started.
[main] INFO org.apache.cayenne.log.JdbcEventLogger - INSERT INTO cayenne_demo.artist
(DATE_OF_BIRTH, NAME) VALUES (?, ?)
[main] INFO org.apache.cayenne.log.JdbcEventLogger - [bind: 1->DATE_OF_BIRTH:NULL, 2-
>NAME:'Picasso']
[main] INFO org.apache.cayenne.log.JdbcEventLogger - Generated PK: ARTIST.ID = 2
[main] INFO org.apache.cayenne.log.JdbcEventLogger - === updated 1 row.
[main] INFO org.apache.cayenne.log.JdbcEventLogger - +++ transaction committed.
```

Chapter 5. What's next

That's all for this tutorial! Now you know how to setup and use `cayenne-maven-plugin`.

Next step will be creating your first application with Cayenne. If you not passed yet, you can try out [getting-started](#) tutorial.

You can find detailed information about configuring this plugin in [documentation](#) available on Cayenne site.
