#### 4.1.1 Detailed Description

Functions which are calling the vserver syscall directly.

#### 4.1.2 Function Documentation

##### 4.1.2.1 `xid_t vc_ctx_create ( xid_t xid, struct vc_ctx_flags *flags )`

Creates a context without starting it.

This functions initializes a new context. When already in a freshly created context, this old context will be discarded.

<i>xid</i>	The new context; special values are: <ul style="list-style-type: none"> <li>• VC_DYNAMIC_XID which means to create a dynamic context</li> </ul>
------------	---

#### Returns

the xid of the created context, or VC\_NOCTX on errors. `errno` will be set appropriately.

#### 4.1.2.2 `int vc_ctx_migrate ( xid_t xid, uint_least64_t flags )`

Moves the current process into the specified context.

##### Parameters

<i>xid</i>	The new context
<i>flags</i>	The flags, see VC_VXM_*

##### Returns

0 on success, -1 on errors

#### 4.1.2.3 `int vc_ctx_stat ( xid_t xid, struct vc_ctx_stat * stat )`

Get some statistics about a context.

##### Parameters

<i>xid</i>	The context to get stats about
<i>stat</i>	Where to store the result

#### 4.1.2.4 `int vc_get_iattr ( char const * filename, xid_t * xid, uint_least32_t * flags, uint_least32_t * mask )`

Returns information about attributes and assigned context of a file.

This function returns the VC\_IATTR\_XXX flags and about the assigned context of a file. To request an information, the appropriate bit in *mask* must be set and the corresponding parameter (*xid* or *flags*) must not be NULL.

E.g. to receive the assigned context, the VC\_IATTR\_XID bit must be set in *mask*, and *xid* must point to valid memory.

Possible flags are VC\_IATTR\_ADMIN, VC\_IATTR\_WATCH, VC\_IATTR\_HIDE, VC\_IATTR\_BARRIER, VC\_IATTR\_IUNLINK and VC\_IATTR\_IMMUTABLE.

##### Parameters

<i>filename</i>	The name of the file whose attributes shall be determined.
<i>xid</i>	When non-zero and the VC_IATTR_XID bit is set in <i>mask</i> , the assigned context of <i>filename</i> will be stored there.

<i>flags</i>	When non-zero, a bitmask of current attributes will be stored there. These attributes must be requested explicitly by setting the appropriate bit in <i>mask</i>
<i>mask</i>	Points to a bitmask which tells which attributes shall be determined. On return, it will masquerade the attributes which were determined.

**Precondition**

```
mask!=0 && !((*mask&VC_IATTR_XID) && xid==0) && !((*mask&~VC_IATTR_XID) && flags==0)
```

**WARNING:** this function can modify `errno` although no error happened.

**Parameters**

<i>filename</i>	The file to check
-----------------	-------------------

**Returns**

The assigned context, or VC\_NOCTX when an error occurred or no such assignment exists. `errno` will be 0 in the latter case

- bool [vc\\_parseLimit](#) (char const \*str, [vc\\_limit\\_t](#) \*res) VC\_ATTR\_NONNULL((1)  
  
*Parses a string describing a limit*  
*This function parses str and interprets special words like "inf" or suffixes. Valid suffixes are*

ELEM    <- '~' ELEM | MASK | NAME
MASK    <- NUMBER | '^' NUMBER
NUMBER  <- 0[0-7]* | [1-9][0-9]* | 0x[0-9,a-f]+
NAME    <- <literal name> | "all" | "any" | "none"
.

```

### 4.2.1 Detailed Description

Functions which are doing general helper tasks like parameter parsing.

### 4.2.2 Function Documentation

#### 4.2.2.1 `int vc_list2bcap ( char const * str, size_t len, struct vc_err_listparser * err, struct vc_ctx_caps * cap )`

Converts a string into a bcapability-bitmask

Syntax of *str*:

```

LIST    <- ELEM | ELEM ',' LIST
ELEM    <- '~' ELEM | MASK | NAME
MASK    <- NUMBER | '^' NUMBER
NUMBER  <- 0[0-7]* | [1-9][0-9]* | 0x[0-9,a-f]+
NAME    <- <literal name> | "all" | "any" | "none"
.

```

When the '~' prefix is used, the bits will be unset and a '~' after another '~' will cancel both ones. The '^' prefix specifies a bitnumber instead of a bitmask.

"literal name" is everything which will be accepted by the `vc_text2bcap()` function. The special values for NAME will be recognized case insensitively

#### Parameters

<i>str</i>	The string to be parsed
<i>len</i>	The length of the string, or 0 for automatic detection
<i>err</i>	Pointer to a structure for error-information, or NULL.
<i>cap</i>	Pointer to a <code>vc_ctx_caps</code> structure holding the results; only the <i>bcaps</i> and <i>bmask</i> fields will be changed and already set values will not be honored. When an error occurred, <i>cap</i> will have the value of all processed valid BCAP parts.

#### Returns

0 on success, -1 on error. In error case, *err* will hold position and length of the first not understood BCAP part

**Precondition**

$str \neq 0$  &&  $cap \neq 0$ ;  $cap \rightarrow bcaps$  and  $cap \rightarrow bmask$  must be initialized

**4.2.2.2 char const\* vc\_lobcap2text ( uint\_least64\_t \* val )**

Converts the lowest bit of a bcapability or the entire value (when possible) to a textual representation.

**Parameters**

<i>val</i>	The string to be converted; on success, the detected bit(s) will be unset, in errorcase only the lowest set bit
------------	---

**Returns**

A textual representation of *val* resp. of its lowest set bit; or `NULL` in errorcase.

**Precondition**

$val \neq 0$

**Postcondition**

$*val_{old} \neq 0 \leftrightarrow *val_{old} > *val_{new}$   
 $*val_{old} == 0 \leftrightarrow result == 0$

**4.2.2.3 bool vc\_parseLimit ( char const \* str, vc\_limit\_t \* res )**

Parses a string describing a limit

This function parses *str* and interprets special words like "inf" or suffixes. Valid suffixes are

- k ... 1000
- m ... 1000000
- K ... 1024
- M ... 1048576.

**Parameters**

<i>str</i>	The string which shall be parsed
<i>res</i>	Will be filled with the interpreted value; in errorcase, this value is undefined.

**Returns**

*true*, iff the string *str* could be parsed. *res* will be filled with the interpreted value in this case.

**Precondition**

*str*!=0 && *res*!=0

**4.2.2.4 uint\_least64\_t vc\_text2bcap ( char const \* *str*, size\_t *len* )**

Converts a single string into bcability.

**Parameters**

<i>str</i>	The string to be parsed; both "CAP_XXX" and "XXX" will be accepted
<i>len</i>	The length of the string, or 0 for automatic detection

**Returns**

### 6.2.1 Detailed Description

The public interface of the the libvserver library.

Definition in file [vserver.h](#).

### 6.2.2 Define Documentation

#### 6.2.2.1 #define VC\_DYNAMIC\_XID ((xid\_t)(-1))

the value which means a random (the next free) ctx

Definition at line 67 of file [vserver.h](#).

**6.2.2.2 #define VC\_NOCTX ((xid\_t)(-1))**

the value which is returned in error-case (no ctx found)

Definition at line 64 of file vserver.h.

**6.2.2.3 #define VC\_SAMECTX ((xid\_t)(-2))**

the value which means the current ctx

Definition at line 69 of file vserver.h.

**6.2.3 Typedef Documentation****6.2.3.1 typedef uint\_least64\_t vc\_limit\_t**

The type which is used for a single limit value.

Special values are

- VC\_LIM\_INFINITY ... which is the infinite value
- VC\_LIM\_KEEP ... which is used to mark values which shall not be modified by the [vc\\_set\\_rlimit\(\)](#) operation.

Else, the interpretation of the value depends on the corresponding resource; it might be bytes, pages, seconds or litres of beer.

Definition at line 566 of file vserver.h.

**6.2.3.2 an\_unsigned\_integer\_type xid\_t**

The identifier of a context.

Definition at line 359 of file vserver.h.

**6.2.4 Function Documentation****6.2.4.1 int vc\_add\_dlimit ( char const \**filename*, xid\_t *xid*, uint\_least32\_t *flags* )**

Add a disk limit to a file system.

**6.2.4.2 int vc\_createSkeleton ( char const \**id*, vcCfgStyle *style*, int *flags* )**

Create a basic configuration skeleton for a vserver plus toplevel directories for pkgmanagment and filesystem (when requested).

**6.2.4.3** `int int vc_get_dlimit ( char const * filename, xid_t xid, uint_least32_t flags, struct vc_ctx_dlimit * limits )`

Get a disk limit.

**6.2.4.4** `tag_t vc_get_task_tag ( pid_t pid )`

Get the filesystem tag for a process.

**6.2.4.5** `char* vc_getVserverAppDir ( char const * id, vcCfgStyle style, char const * app )`

Returns the path of the configuration directory for the given application. The result will be allocated and must be freed by the caller.

**6.2.4.6** `char* vc_getVserverByCtx ( xid_t ctx, vcCfgStyle * style, char const * revdir )`

Resolves the cfg-path of the vserver owning the given ctx. 'revdir' will be used as the directory holding the mapping-links; when NULL, the default value will be assumed. The result will be allocated and must be freed by the caller.

**6.2.4.7** `char* vc_getVserverCfgDir ( char const * id, vcCfgStyle style )`

Returns the path of the vserver configuration directory. When the given vserver does not exist, or when it does not have such a directory, NULL will be returned. Else, the result will be allocated and must be freed by the caller.

**6.2.4.8** `xid_t vc_getVserverCtx ( char const * id, vcCfgStyle style, bool honor_static, bool * is_running, vcCtxType type )`

Returns the ctx of the given vserver. When vserver is not running and 'honor\_static' is false, VC\_NOCTX will be returned. Else, when 'honor\_static' is true and a static assignment exists, those value will be returned. Else, the result will be VC\_NOCTX.

When 'is\_running' is not null, the status of the vserver will be assigned to this variable.

**6.2.4.9** `char* vc_getVserverName ( char const * id, vcCfgStyle style )`

Resolves the name of the vserver. The result will be allocated and must be freed by the caller.

**6.2.4.10** `char* vc_getVserverVdir ( char const * id, vcCfgStyle style, bool physical )`

Returns the path to the vserver root-directory. The result will be allocated and must be freed by the caller.

**6.2.4.11** `bool vc_is_dynamic_xid ( xid_t xid )`

Returns true iff *xid* is a dynamic xid

**6.2.4.12** `nid_t vc_nidopt2nid ( char const *, bool honor_static, char const ** err_info )`

Maps a nid given at '--nid' options to a nid\_t

**6.2.4.13** `int vc_rem_dlimit ( char const * filename, xid_t xid, uint_least32_t flags )`

Remove a disk limit from a file system.

**6.2.4.14** `int vc_set_dlimit ( char const * filename, xid_t xid, uint_least32_t flags, struct vc_ctx_dlimit const * limits )`

Set a disk limit.

**6.2.4.15** `int vc_tag_create ( tag_t tag )`

Create a new filesystem tag space.

**6.2.4.16** `int vc_tag_migrate ( tag_t tag )`

Migrate to an existing filesystem tag space.

**6.2.4.17** `tag_t vc_tagopt2tag ( char const *, bool honor_static, char const ** err_info )`

Maps a tag given at '--tag' options to a tag\_t

**6.2.4.18** `xid_t vc_xidopt2xid ( char const *, bool honor_static, char const ** err_info )`

Maps an xid given at '--xid' options to an xid\_t
